This Assignment is (check one):

[X] On Time [ ] Late, without deduction [ ] Late, with deduction

Comments: Feel free to work with other students, but make sure you write up the homework and code on your own (no copying homework *or* code; no pair programming). Feel free to ask students or instructors for help debugging code or whatever else, though.

The starter code for problem 2 part c and d can be found under the Resource tab on course website.

Note: You need to create a Github account for submission of the coding part of the homework. Please create a repository on Github to hold all your code and include your Github account username as part of the answer to problem 2.

Problem 1. (Linear Transformation)

Let $\mathbf{y} = A\mathbf{x} + \mathbf{b}$ be a random vector. Show that expectation is linear:

$$\mathbb{E}[\mathbf{y}] = \mathbb{E}[A\mathbf{x} + \mathbf{b}] = A\mathbb{E}[\mathbf{x}] + \mathbf{b}.$$

Also show that

$$\operatorname{cov}[\mathbf{y}] = \operatorname{cov}[A\mathbf{x} + \mathbf{b}] = A \operatorname{cov}[\mathbf{x}] A^\top = A\boldsymbol{\Sigma}A^\top.$$

Solution:

(a) We have

$$\begin{aligned}\mathbb{E}[\mathbf{y}] &= \mathbb{E}[A\mathbf{x} + \mathbf{b}] \\ &= \mathbb{E}[A\mathbf{x}] + \mathbb{E}[\mathbf{b}] \\ &= \mathbb{E}[A\mathbf{x}] + \mathbf{b}\end{aligned}$$

(we got from the second line to the third by the fact that $\mathbb{E}[X + Y] = \mathbb{E}[X] + \mathbb{E}[Y]$ for random variables X and Y, and from the second to the third by the fact that the expected value of a constant is the constant itself). It remains to show that $\mathbb{E}[A\mathbf{x}] = A\mathbb{E}[\mathbf{x}]$. Suppose $\mathbf{x}$ is an n-dimensional random vector in a space X:

$$\mathbf{x} = \begin{bmatrix} x_0 \\ x_1 \\ \vdots \\ x_n \end{bmatrix}$$

where each of the $x_i \in \mathbb{R}$. By definition, the expectation value of $\mathbf{x}$ is given by

$$\mathbb{E}[\mathbf{x}] = \begin{bmatrix} \mathbb{E}[x_0] \\ \mathbb{E}[x_1] \\ \vdots \\ \mathbb{E}[x_n] \end{bmatrix}$$

and for any continuous random variable, we have

$$\mathbb{E}[Y] = \int_{-\infty}^{\infty} y f(y) \, \mathrm{d}y$$

where $f(y)$ is some probability density function. For each of the x_i, define $f_i(x_i)$ to be the corresponding probability density function. Then

$$\mathbb{E}[\mathbf{x}] = \begin{bmatrix} \displaystyle\int_{-\infty}^{\infty} x_0 f_0(x_0) \, \mathrm{d}x_0 \\ \displaystyle\int_{-\infty}^{\infty} x_1 f_1(x_1) \, \mathrm{d}x_1 \\ \vdots \\ \displaystyle\int_{-\infty}^{\infty} x_n f_n(x_n) \, \mathrm{d}x_n \end{bmatrix}$$

Let $A \in M_{m\times n}(\mathbb{R})$, with rows $\mathbf{a}_0$, $\mathbf{a}_1$, …, $\mathbf{a}_m$.

$$A\mathbf{x} = \begin{bmatrix} a_{0,0} & a_{0,1} & \cdots & a_{0,n} \\ a_{1,0} & a_{1,1} & \cdots & a_{1,n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m,0} & a_{m,1} & \cdots & a_{m,n} \end{bmatrix} \begin{bmatrix} x_0 \\ x_1 \\ \vdots \\ x_n \end{bmatrix}$$

$$= \begin{bmatrix} \langle \mathbf{a}_0, \mathbf{x} \rangle \\ \langle \mathbf{a}_1, \mathbf{x} \rangle \\ \vdots \\ \langle \mathbf{a}_m, \mathbf{x} \rangle \end{bmatrix}$$

Using the standard Euclidean inner product, we have

$$= \begin{bmatrix} \sum_{i=0}^{n} a_{0,i}x_i \\ \sum_{i=0}^{n} a_{1,i}x_i \\ \vdots \\ \sum_{i=0}^{n} a_{m,i}x_i \end{bmatrix}$$

Problem 2.

Given the dataset $\mathcal{D} = \{(x, y)\} = \{(0, 1), (2, 3), (3, 6), (4, 8)\}$

(a) Find the least squares estimate $y = \boldsymbol{\theta}^\top \mathbf{x}$ by hand using Cramer's Rule.

(b) Use the normal equations to find the same solution and verify it is the same as part (a).

(c) Plot the data and the optimal linear fit you found.

(d) Find randomly generate 100 points near the line with white Gaussian noise and then compute the least squares estimate (using a computer). Verify that this new line is close to the original and plot the new dataset, the old line, and the new line.

Solution:
