This Assignment is (check one):

On Time

Late, without deduction

Late, with deduction

Comments: Feel free to work with other students, but make sure you write up the homework and code on your own (no copying homework *or* code; no pair programming). Feel free to ask students or instructors for help debugging code or whatever else, though.

The starter code for problem 2 part c and d can be found under the Resource tab on course website.

Note: You need to create a Github account for submission of the coding part of the homework. Please create a repository on Github to hold all your code and include your Github account username as part of the answer to problem 2.

Problem 1. (Linear Transformation)

Let $\mathbf{y} = A\mathbf{x} + \mathbf{b}$ be a random vector. Show that expectation is linear:

$$\mathbb{E}[\mathbf{y}] = \mathbb{E}[A\mathbf{x} + \mathbf{b}] = A\mathbb{E}[\mathbf{x}] + \mathbf{b}.$$

Also show that

$$\text{cov}[\mathbf{y}] = \text{cov}[A\mathbf{x} + \mathbf{b}] = A \text{cov}[\mathbf{x}] A^\top = A\Sigma A^\top.$$

Solution:

(a) First, we prove some small lemmas.

Lemma 1.1. *Let X be a continuous random variable, and a be a scalar. Then $\mathbb{E}[aX] = a\mathbb{E}[X]$.*

Proof. Let X admit a density function $f(x)$. Then

$$\begin{aligned} \mathbb{E}[aX] &= \int_{-\infty}^{\infty} axf(x) \, dx \\ &= a \int_{-\infty}^{\infty} xf(x) \, dx \\ &= a\mathbb{E}[X] \end{aligned}$$

Lemma 1.2. *Let X be a random variable, and let a be a scalar. Then $\mathbb{E}[X + a] = \mathbb{E}[X] + \mathbb{E}[a] = \mathbb{E}[X] + a$.* ■

Proof. Let X admit a density function $f(x)$. Then over \mathbb{R} , $f(x)$ must integrate to 1. Hence

$$\begin{aligned} \int_{-\infty}^{\infty} (x + a)f(x) \, dx &= \int_{-\infty}^{\infty} xf(x) + af(x) \, dx \\ &= \int_{-\infty}^{\infty} xf(x) \, dx + \int_{-\infty}^{\infty} af(x) \, dx \\ &= \int_{-\infty}^{\infty} xf(x) \, dx + a \int_{-\infty}^{\infty} f(x) \, dx \\ &= \mathbb{E}[X] + a \cdot 1 \\ &= \mathbb{E}[X] + a \end{aligned}$$

Lemma 1.3. *Let X and Y be continuous random variables. Then $\mathbb{E}[X + Y] = \mathbb{E}[X] + \mathbb{E}[Y]$.* ■

Proof. Let $X + Y$ have a density function $f(x, y)$. Then

$$\begin{aligned} \mathbb{E}[X + Y] &= \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} (x + y)f(x, y) \, dx \, dy \\ &= \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} xf(x, y) \, dx \, dy + \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} yf(x, y) \, dx \, dy \\ &= \mathbb{E}[X] + \mathbb{E}[Y] \end{aligned}$$

Now we do the main problem. By the lemmas, we have

$$\mathbb{E}[\mathbf{y}] = \mathbb{E}[A\mathbf{x} + \mathbf{b}]$$

$$\begin{aligned}
&= \mathbb{E}[A\mathbf{x}] + \mathbb{E}[\mathbf{b}] \\
&= \mathbb{E}[A\mathbf{x}] + \mathbf{b}
\end{aligned}$$

It remains to show that $\mathbb{E}[A\mathbf{x}] = A\mathbb{E}[\mathbf{x}]$. Suppose \mathbf{x} is an n -dimensional random vector in a space X :

$$\mathbf{x} = \begin{bmatrix} x_0 \\ x_1 \\ \vdots \\ x_n \end{bmatrix}$$

where each of the $x_i \in \mathbb{R}$. By definition, the expectation value of \mathbf{x} is given by

$$\mathbb{E}[\mathbf{x}] = \begin{bmatrix} \mathbb{E}[x_0] \\ \mathbb{E}[x_1] \\ \vdots \\ \mathbb{E}[x_n] \end{bmatrix}$$

Let $A \in M_{m \times n}(\mathbb{R})$, with rows $\mathbf{a}_0, \mathbf{a}_1, \dots, \mathbf{a}_m$. Then $A\mathbb{E}[\mathbf{x}]$ is given by

$$\begin{aligned}
A\mathbb{E}[\mathbf{x}] &= \begin{bmatrix} a_{0,0} & a_{0,1} & \cdots & a_{0,n} \\ a_{1,0} & a_{1,1} & \cdots & a_{1,n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m,0} & a_{m,1} & \cdots & a_{m,n} \end{bmatrix} \begin{bmatrix} \mathbb{E}[x_0] \\ \mathbb{E}[x_1] \\ \vdots \\ \mathbb{E}[x_n] \end{bmatrix} \\
&= \begin{bmatrix} \sum_{i=0}^n a_{0,i} \mathbb{E}[x_i] \\ \sum_{i=0}^n a_{1,i} \mathbb{E}[x_i] \\ \vdots \\ \sum_{i=0}^n a_{n,i} \mathbb{E}[x_i] \end{bmatrix}
\end{aligned}$$

Now, we manipulate this expression to obtain $\mathbb{E}[A\mathbf{x}]$. Because the expected value of a sum is the sum of expected values (see lemmas), we have

$$\begin{bmatrix} \sum_{i=0}^n a_{0,i} \mathbb{E}[x_i] \\ \sum_{i=0}^n a_{1,i} \mathbb{E}[x_i] \\ \vdots \\ \sum_{i=0}^n a_{n,i} \mathbb{E}[x_i] \end{bmatrix} = \begin{bmatrix} \mathbb{E} \left[\sum_{i=0}^n a_{0,i} x_i \right] \\ \mathbb{E} \left[\sum_{i=0}^n a_{1,i} x_i \right] \\ \vdots \\ \mathbb{E} \left[\sum_{i=0}^n a_{n,i} x_i \right] \end{bmatrix}$$

and now because the expected value of a vector is a vector of expected values,

$$\begin{aligned} \begin{bmatrix} \mathbb{E} \left[\sum_{i=0}^n a_{0,i} x_i \right] \\ \mathbb{E} \left[\sum_{i=0}^n a_{1,i} x_i \right] \\ \vdots \\ \mathbb{E} \left[\sum_{i=0}^n a_{n,i} x_i \right] \end{bmatrix} &= \mathbb{E} \begin{bmatrix} \sum_{i=0}^n a_{0,i} x_i \\ \sum_{i=0}^n a_{1,i} x_i \\ \vdots \\ \sum_{i=0}^n a_{n,i} x_i \end{bmatrix} \\ &= \mathbb{E}[A\mathbf{x}] \end{aligned}$$

hence $A\mathbb{E}[\mathbf{x}] = \mathbb{E}[A\mathbf{x}]$, and so putting all the pieces together,

$$\boxed{\mathbb{E}[A\mathbf{x} + \mathbf{b}] = A\mathbb{E}[\mathbf{x}] + \mathbf{b}}$$

as desired. ■

(b) We have the following corollary to part (a):

Corollary 1.3.1. *Let A be a matrix, and let \mathbf{x} be a random vector. Then $\mathbb{E}[\mathbf{x}A^\top] = \mathbb{E}[\mathbf{x}]A^\top$.*

Proof. Note that

$$\begin{aligned} \mathbb{E}[\mathbf{x}A^\top] &= \mathbb{E} \left[\left((\mathbf{x}A^\top)^\top \right)^\top \right] \\ &= \mathbb{E} \left[(A\mathbf{x}^\top)^\top \right] \\ &= (\mathbb{E}[A\mathbf{x}^\top])^\top \\ &= (A\mathbb{E}[\mathbf{x}^\top])^\top \\ &= (\mathbb{E}[\mathbf{x}^\top])^\top A^\top \\ &= \mathbb{E}[\mathbf{x}]A^\top \end{aligned}$$
■

Now, we proceed to the main proof. The covariance matrix $\text{cov}[\mathbf{y}]$ is defined by

$$\begin{aligned} \text{cov}[\mathbf{y}] &= \begin{bmatrix} \mathbb{E}[(y_0 - \mathbb{E}[y_0])(y_0 - \mathbb{E}[y_0])] & \mathbb{E}[(y_0 - \mathbb{E}[y_0])(y_1 - \mathbb{E}[y_1])] & \cdots & \mathbb{E}[(y_0 - \mathbb{E}[y_0])(y_n - \mathbb{E}[y_n])] \\ \mathbb{E}[(y_1 - \mathbb{E}[y_1])(y_0 - \mathbb{E}[y_0])] & \mathbb{E}[(y_1 - \mathbb{E}[y_1])(y_1 - \mathbb{E}[y_1])] & \cdots & \mathbb{E}[(y_1 - \mathbb{E}[y_1])(y_n - \mathbb{E}[y_n])] \\ \vdots & \vdots & \ddots & \vdots \\ \mathbb{E}[(y_n - \mathbb{E}[y_n])(y_0 - \mathbb{E}[y_0])] & \mathbb{E}[(y_n - \mathbb{E}[y_n])(y_1 - \mathbb{E}[y_1])] & \cdots & \mathbb{E}[(y_n - \mathbb{E}[y_n])(y_n - \mathbb{E}[y_n])] \end{bmatrix} \\ &= \begin{bmatrix} \text{cov}(y_0, y_0) & \text{cov}(y_0, y_1) & \cdots & \text{cov}(y_0, y_n) \\ \text{cov}(y_1, y_0) & \text{cov}(y_1, y_1) & \cdots & \text{cov}(y_1, y_n) \\ \vdots & \vdots & \ddots & \vdots \\ \text{cov}(y_n, y_0) & \text{cov}(y_n, y_1) & \cdots & \text{cov}(y_n, y_n) \end{bmatrix} \end{aligned}$$

it is a property of covariance that for all random variables X and Y , with scalars a and b , $\text{cov}(X + a, Y + b) = \text{cov}(X, Y)$. Hence, since each $y_i = (A\mathbf{x})_i + b_i$, then $\forall i, j \in \{0, 1, \dots, n\}$,

$$\text{cov}[y_i, y_j] = \text{cov}[(A\mathbf{x})_i + b_i, (A\mathbf{x})_j + b_j]$$

$$= \text{cov}[(A\mathbf{x})_i, (A\mathbf{x})_j]$$

thus, examining the matrix above, we see $\text{cov}[A\mathbf{x} + \mathbf{b}] = \text{cov}[A\mathbf{x}]$. It remains to show $\text{cov}[A\mathbf{x}] = A \text{cov}[\mathbf{x}] A^\top$.

Note that we can reexpress the covariance matrix by

$$\begin{aligned} \text{cov}[\mathbf{y}] &= \mathbb{E} \left[\begin{bmatrix} (y_0 - \mathbb{E}[y_0])(y_0 - \mathbb{E}[y_0]) & (y_0 - \mathbb{E}[y_0])(y_1 - \mathbb{E}[y_1]) & \cdots & (y_0 - \mathbb{E}[y_0])(y_n - \mathbb{E}[y_n]) \\ (y_1 - \mathbb{E}[y_1])(y_0 - \mathbb{E}[y_0]) & (y_1 - \mathbb{E}[y_1])(y_1 - \mathbb{E}[y_1]) & \cdots & (y_1 - \mathbb{E}[y_1])(y_n - \mathbb{E}[y_n]) \\ \vdots & \vdots & \ddots & \vdots \\ (y_n - \mathbb{E}[y_n])(y_0 - \mathbb{E}[y_0]) & (y_n - \mathbb{E}[y_n])(y_1 - \mathbb{E}[y_1]) & \cdots & (y_n - \mathbb{E}[y_n])(y_n - \mathbb{E}[y_n]) \end{bmatrix} \right] \\ &= \mathbb{E}[(\mathbf{y} - \mathbb{E}[\mathbf{y}])(\mathbf{y} - \mathbb{E}[\mathbf{y}])^\top] \\ &= \mathbb{E}[(A\mathbf{x} - \mathbb{E}[A\mathbf{x}]) (A\mathbf{x} - \mathbb{E}[A\mathbf{x}])^\top] \end{aligned}$$

by part (a),

$$\begin{aligned} &= \mathbb{E}[(A\mathbf{x} - A\mathbb{E}[\mathbf{x}]) (A\mathbf{x} - A\mathbb{E}[\mathbf{x}])^\top] \\ &= \mathbb{E}[(A\mathbf{x} - A\mathbb{E}[\mathbf{x}]) (\mathbf{x}^\top A^\top - \mathbb{E}[\mathbf{x}]^\top A^\top)] \\ &= \mathbb{E}[A(\mathbf{x} - \mathbb{E}[\mathbf{x}]) (\mathbf{x}^\top - \mathbb{E}[\mathbf{x}]^\top) A^\top] \\ &= \mathbb{E}[A(\mathbf{x} - \mathbb{E}[\mathbf{x}]) (\mathbf{x} - \mathbb{E}[\mathbf{x}])^\top A^\top] \\ &= A \mathbb{E}[(\mathbf{x} - \mathbb{E}[\mathbf{x}]) (\mathbf{x} - \mathbb{E}[\mathbf{x}])^\top] A^\top \\ &= A \text{cov}[\mathbf{x}] A^\top = A \Sigma A^\top \end{aligned}$$

hence, putting it all together, we have

$$\boxed{\text{cov}[A\mathbf{x} + \mathbf{b}] = A \text{cov}[\mathbf{x}] A^\top}$$

■

Problem 2.

Given the dataset $\mathcal{D} = \{(x, y)\} = \{(0, 1), (2, 3), (3, 6), (4, 8)\}$

- Find the least squares estimate $y = \theta^\top \mathbf{x}$ by hand using Cramer's Rule.
- Use the normal equations to find the same solution and verify it is the same as part (a).
- Plot the data and the optimal linear fit you found.
- Find randomly generate 100 points near the line with white Gaussian noise and then compute the least squares estimate (using a computer). Verify that this new line is close to the original and plot the new dataset, the old line, and the new line.

Solution:

My github username is `redpanda1234`.

- (a) By Cramer's rule, we have

$$\begin{aligned}
 m &= \frac{n \sum_{i=1}^n [x_i y_i] - \left(\sum_{i=1}^n x_i \right) \left(\sum_{i=1}^n y_i \right)}{n \sum_{i=1}^n [x_i^2] - \left(\sum_{i=1}^n x_i \right)^2} \\
 &= \frac{4(0 + 6 + 18 + 32) - (0 + 2 + 3 + 4)(1 + 3 + 6 + 8)}{4(0 + 4 + 9 + 16) - (0 + 2 + 3 + 4)^2} \\
 &= \frac{4(56) - (9 \cdot 8)}{4(29) - 9^2} \\
 &= \frac{224 - 162}{116 - 81} \\
 &= \boxed{\frac{62}{35}}
 \end{aligned}$$

and

$$\begin{aligned}
 b &= \frac{\left(\sum_{i=1}^n x_i^2 \right) \left(\sum_{i=1}^n y_i \right) - \left(\sum_{i=1}^n x_i \right) \left(\sum_{i=1}^n x_i y_i \right)}{n \sum_{i=1}^n [x_i^2] - \left(\sum_{i=1}^n x_i \right)^2} \\
 &= \frac{(0 + 4 + 9 + 16)(1 + 3 + 6 + 8) - (0 + 2 + 3 + 4)(0 + 6 + 18 + 32)}{35} \\
 &= \frac{29 \cdot 18 - 9 \cdot 56}{35} \\
 &= \frac{522 - 504}{35} \\
 &= \boxed{\frac{18}{35}}
 \end{aligned}$$

- (b) By the normal equation,

$$X^\top \mathbf{y} = X^\top X \boldsymbol{\theta}$$

we have

$$X = \begin{bmatrix} 1 & 0 \\ 1 & 2 \\ 1 & 3 \\ 1 & 4 \end{bmatrix} \quad \mathbf{y} = \begin{bmatrix} 1 \\ 3 \\ 6 \\ 8 \end{bmatrix}$$

thus

$$X^T X = \begin{bmatrix} 4 & 9 \\ 9 & 29 \end{bmatrix}$$

and

$$X^T \mathbf{y} = \begin{bmatrix} 18 \\ 56 \end{bmatrix}$$

hence

$$\begin{bmatrix} 18 \\ 56 \end{bmatrix} = \begin{bmatrix} 4 & 9 \\ 9 & 29 \end{bmatrix} \begin{bmatrix} \theta_0 \\ \theta_1 \end{bmatrix}$$

so we solve the following:

$$\begin{array}{c} \left[\begin{array}{cc|c} 4 & 9 & 18 \\ 9 & 29 & 56 \end{array} \right] \\ \left[\begin{array}{cc|c} 4 & 9 & 18 \\ 1 & 11 & 20 \end{array} \right] \\ \left[\begin{array}{cc|c} 0 & -35 & -62 \\ 1 & 11 & 20 \end{array} \right] \\ \left[\begin{array}{cc|c} 0 & 1 & \frac{62}{35} \\ 1 & 11 & 20 \end{array} \right] \\ \left[\begin{array}{cc|c} 0 & 1 & \frac{62}{35} \\ 1 & 0 & \frac{18}{35} \end{array} \right] \end{array}$$

thus

$$\boldsymbol{\theta} = \begin{bmatrix} b \\ m \end{bmatrix} = \begin{bmatrix} \frac{62}{35} \\ \frac{18}{35} \end{bmatrix}$$

as in part (a).
